

Easily 0.715.0

2025-11-24 17:32:39

The changes and bugs corrected in versions 0.710.1 are included in this version.

General

- Features:
 - #18195:  Integrated Kafka client into Easily.
- Bug fixes:
 - #18545:  (v0.710.1) Pendo tracking values were not correctly set.
 - #18294:  Fixed some vulnerabilities related to validating request body coming from user.
 - #18489:  Fix some field meatype label to label18n. No impact in apps.
 - #18294:  Fixed vulnerabilities related to path traversal.
 - #18393:  Added MOS token in sec-websocket-protocol header for websocket validation. Only for full MOS login.

Site parameters

Information

- Features:
 - #18420:  The settings for possible origins for withdrawals made in the 'Stock withdrawals' screen are no longer configured in the 'Site parameters > Information' screen, but in the 'Sites>Site settings' screen.

Workflows

- Features:
 - #18416:  When configuring a supplier order workflow rule, it is now possible to choose whether it applies to all suppliers or only to those for whom the 'Enable order validation workflow' option is enabled in their record.

Sites

Site settings

- Features:
 - #18420:  A Stock section has been added to the 'Sites > Site Settings' screen. It now contains the settings for possible origins for stock removals made in the 'Stock Removals' screen (which was previously done in the 'Site Settings > Information' screen).
 - #18420:  Addition of a third selectable origin in the settings for stock withdrawals: 'Site orders (supply)'.
 - #18478:  In the 'POS data' section of the site settings screen, a 'Data redirection' area has been added. It allows you to set rules for redirecting cash register data (sales and losses). This setting can be configured by specifying the sales mode. For example: all sales received from the cash register with an 'on-site' sales mode must be redirected to another site. This allows you to meet grouping or dispatch requirements.

Products

Suppliers

- Features:
 - #18416:  Addition of a 'Enable order validation workflow' setting to define whether the supplier is affected by the order validation workflow. This option is only visible if an order validation workflow is defined, and it can only be modified if the workflow has been configured to apply only to suppliers with the option enabled.

Price lists

- Bug fixes:
 - #18495:  Reset extId field when duplicating a pricelist.

Smart Catalogue®

- Features:
 - #18431:  The 'Supplier type' criterion (internal/external) is now included in the Smart Catalogue engine. This means that when this criterion is used in a smart catalogue rule, it is now taken into account throughout the rest of the application.

Recipes

Recipes management

- Features:
 - #18510: The label for the meal type is now a multilingual field.
- Bug fixes:
 - #18521: (v0.710.1) Fixed an issue where recipes created in a different language than the server's default language could not be updated.
 - #18501: Fixed a bug with the display of "Adapted Recipe" icon

Sales

POS data

- Features:

- #18478:  Added /pos-data-routing-rule API to manage POS data routing rules.
- #18478:  Added /sale-mode API to manage sale modes and their extlds.

Nutrition

Nutrition families

- Features:
 - #18510: The label for the meal type is now a multilingual filed.

Constraints on nutrition families

- Features:
 - #18510: The label for the meal type is now a multilingual filed.

Meal plans

- Features:
 - #18510: The label for the meal type is now a multilingual filed.

Menus

Menus

- Features:
 - #18510: The label for the meal type is now a multilingual filed.
- Bug fixes:
 - #15919: In the screen for duplicating a menu period to other sites, a date was indicated in the 'until' field even if the 'Repeat' box was not checked. This is no longer the case.

Smart Selection®

- Features:
 - #18379:  Texture, Segments, Diet added as the new criterion types.

Menu pre-design

- Features:
 - #18496:  It is now possible to duplicate a recipe to all days of the week with a single click.

Supplier orders

Supplier order

- Features:
 - #18437:  Takes into account changes in the supplier order workflow (option on the workflow rule and supplier record), so validation will only be requested for targeted suppliers.

Track orders

- Features:
 - #18543:  Enriched tracking API response with user email and SSO UPN information in author object.

Production

Production management

- Features:
 - #18435:  Automatic generation of batch numbers for finished products: the system now automatically creates a batch number according to the INCO rule (YYYYMMDD-recipeId-siteId-incrementalId), which is then reused when stock is entered. The number can still be modified before validation. The use-by date is also calculated automatically based on the recipe's shelf life and cannot be modified at this stage.

Stock

Stock removal

- Features:
 - #18420:  It is now possible to select 'Site orders (supply)' as the origin for calculating outputs if this origin is authorised for this site in the site settings screen. This allows stock outputs to be made based on orders placed by child sites and visible in the 'Site supply' screen (lab flow).

Tools

Imports / Exports

- Features:
 - #18478:  Use POS data routing rules to redirect sales receipts and losses to another site.

Interfaces

- Features:
 - #18475:  (v0.710.1) Can update external ids with new endpoint
 - #18478:  JES: use POS data routing rules (using Segment id as SaleMode extId) to redirect sales to another site.

Mapal OS

- Features:
 - #18485:  Disable the option to edit the easilys administrator profile
